

Custom Built Bunds

Unibund is a custom built system designed for large or awkward installations. Unibund is made from modular, galvanised corrugated steel panels and features a “no dig” option for cost effective installation around existing tanks and pipe work. We can design, manufacture and install a new build or retrofit system to suit your exact requirements. Unibund can be expanded or moved to another site.

No dig option

Specially designed feet provide the required strength and stability without the need to dig, eliminating the disturbance of underground pipes and cables.

Strength

Z post supports provide the optimum strength without the cost.

Quality liners

Our guaranteed range of liners made from tough durable polymers, are UV light resistant and chosen to suit the ground conditions and type of liquid stored eg. oil, petrol, solvents etc.

Fast installation

Bolt together assembly means installation takes hours not days, and eliminates the need for heavy lifting devices.

Versatile

Modular steel panels create a more streamlined containment system with round or square corners that can fit through awkward and narrow spaces.

Double bolted seams

Panels are joined by two rows of double bolts and seal strip to prevent leakage and provide continuity of strength.
